PowerPC Microprocessor Common Hardware Reference Platform Apple Computer, Inc. 2012-06-25 This book defines the architecture requirements and minimum system requirements for a computer system that is designed to become an open industry standard. These requirements provide a description of the devices, interfaces, and data formats required to design and build a PowerPC-based computer. This standard is designed to provide software compatibility for several operating environments. Systems built to these requirements can use industry-standard components currently found in IBM-compatible and Apple® Macintosh® personal computers. These systems are expected to run various future versions of operating systems including Apple Mac OSTM, IBM AIXTM and PowerPCTM Editions of IBM OS/2 Warp ConnectTM, Microsoft Windows NTTM Workstation, Novell NetwareTM, and SunSoft SolarisTM. This book is the primary source of information for anyone developing a hardware platform, an operating system, or hardware component to be part of these standard systems. It describes the hardware-to-operating-system interface that is essential to anyone building hardware platforms and provides the minimum system configurations that platform designers must meet when building a standard platform. Component manufacturers require this information to produce compatible chips and adapters to use on these platforms, and software developers require the information on mandatory functions and documented interfaces. The architecture is intended to support a range of PowerPC microprocessor-based system implementations including portable, desktop, and server class systems, and allows multiple operating-system implementations across a wide range of environments and functions. This enables new hardware and software enhancements that are necessary for the development of improved user interfaces, higher performance, and broader operating environments.
