Neurologic Differential Diagnosis Alan B. Ettinger 2014-04-17 "There is an apocryphal story of an eminent neurology professor who was asked to provide a differential diagnosis. He allegedly quipped: "I can't give you a differential diagnosis. If you wish I will give you a list of wrong diagnoses followed by the right diagnosis." Sadly, this sort of arrogance pervaded our field, particularly in the era before there were accurate diagnostic methods and effective treatments of neurological diseases. Fortunately, this sort of pomposity is now relegated to the past and remains only as an antique reminder of a type of hubris that precluded discovery and progress in diseases of the nervous system"--

**Pathophysiology of Pain Perception** Stefan Lautenbacher 2004-04-30 Under certain pathological conditions, the pain processing system, which includes both physiological and psychological components, can produce the experience of pain in the absence of any peripheral noxious event. Considerable evidence now indicates that alterations in pain perception are characteristic of many clinical pain states. Pathophysiology of Pain Perception primarily examines these pathological alterations in the pain-signaling system, with contributions from leading researchers in the field focusing on the functioning of the pain processing system under normal and pathological conditions. The understanding of pain perception is essential for optimal diagnosis and treatment of acute and chronic pain. This book covers the basics of pain perception (peripheral and central neurotransmission, methods of assessment), various pathological (chronic pain conditions, neurological and psychiatric diseases, cardiovascular disease), and non-pathological alterations of pain perception (pregnancy, labor) as well as the treatments aiming at influencing pain perception such as pharmacological, physical and psychological treatments.

**Drug-Induced Headache** Hans-Christoph Diener 2012-12-06 M. WILKINSON Patients with frequent or daily headaches pose a very difficult problem for the physician who has to treat them, particularly as many patients think that there should be a medicine or medicines which give them instant relief. In the search for the compound which would meet this very natural desire, many drugs have been manufactured and the temptation for the physician is either to increase the dose of a drug which seems to be, at any rate, partially effective, or to add one or more drugs to those which the patient is already taking. Although there have been some references to the dangers of overdosage of drugs for migraine in the past, it was not until relatively recently that it was recognized that drugs given for the relief of headache, if taken injudiciously, may themselves cause headache. The first drugs to be implicated in this way were ergotamine and phenazone. In the case of ergotamine tartrate, the dangers of ergotism were well known as this was a disorder which had been known and written about for many years. In the treatment of headache, fully blown ergotism is rare and in recent years has usually been due to self-medication in doses much greater than those prescribed although there are a few recorded cases where toxic amounts have been given.

Botulinum Toxin in Painful Diseases Wolfgang H. Jost 2003-01-01 The exceptionally successful history of botulinum toxin and its likely future has hardly an equivalent. Initially, it was used in strabismus, blepharospasm and hemifacial spasm, later also in focal dystonia and spasticity and it has been shown to effectively treat wrinkles, hyperhidrosis and a great number of ensuing indications. By treating symptoms or disorders associated with pain, its analgesic effect was first noticed. The efficacy and reasons for this side effect have since been investigated and a number of models explaining the mode of action have been presented. However, even if we know that botulinum toxin undoubtedly helps in certain pain syndromes, there is still much work to do to identify the major ones, define the optimum dose and the preferred site of injection. Indicating current positions and kindling the growing interest in this extraordinary therapeutic agent this book presents a timely overview on pain management with botulinum toxin. Thus, it will be of great interest especially for anesthesiologists and neurologists in their clinical work and medical research.

Pathophysiology of Headaches Messoud Ashina 2015-04-14 This book provides a detailed overview of the current state of knowledge regarding the pathophysiology of both primary headaches – migraine, tension-type headache (TTH), and cluster headache – and the very important and frequent type of secondary headache, medication overuse headache (MOH). After an introductory chapter describing relevant neuroanatomy and vascular anatomy, the evidence gained from animal models regarding the pathophysiology of migraine and the other primary headaches is reviewed. Knowledge of the genetic component in the different types of headache is then examined with reference to recent evidence, for example regarding the implication of the trigeminovascular system and cortical spreading depression in migraine. Detailed information is provided on insights into primary headaches from imaging studies, including functional magnetic resonance imaging and positron emission tomography and on their neurophysiology and biochemistry. A further series of important chapters describe present knowledge of the pathophysiology of each specific type of headache and consider future directions. Written by acknowledged experts in their fields from Europe and the United States, clinicians and students will find Pathophysiology of Headaches to be an excellent source of up-to-date information on why patients experience headaches. Headaches and Migraines in Childhood Charles F. Barlow 1984 Population surveys tell us that the headache is the most common indisposition of humankind. While most adults are able to take the problem in stride, recurring headache or migraine in childhood can carry more serious implications. Despite this, there has been no major study of the subject for over twenty years. Professor Barlow's book admirably fills this gap. The book starts with a section on classification and epidemiology, then deals with genetics, pathogenesis, and precipitation factors of attacks. There is a thorough chapter on the expression of childhood migraine, and the periodic syndrome is fully defined and discussed. Another major section deals with complex and complicated syndromes and other serious problems such as seizure, stroke and syncope. There is a useful chapter on the treatment of juvenile migraine, and the final two chapters deal with the causes, evaluation, and investigation of symptomatic headache. Dr Barlow illustrates his text with over fifty detailed case histories of his own patients, spanning over twenty years of practice.
